1. Quarkus Foundation

Quantum builds on Quarkus, a Kubernetes-native Java stack optimized for fast startup, low memory footprint, and developer productivity.

1.1. Key Quarkus Capabilities

Developer Experience

- Live reload: Code changes are reflected immediately in dev mode
- Unified config: Single application.properties for all configuration
- **Dev UI**: Rich development interface at http://localhost:8080/g/dev/
- Test-first ergonomics: Built-in test support with @QuarkusTest

Build-time Optimizations

- Classpath indexing: Aggressive build-time analysis reduces runtime scanning
- · Ahead-of-time processing: Framework initialization moved to build time
- Jandex indexes: Annotation discovery without runtime reflection

Cloud Native

- Container integration: Seamless Docker and Kubernetes deployment
- Health checks: Built-in health and readiness endpoints
- Metrics: Micrometer and Prometheus integration
- Configuration: Environment-aware config with profiles

1.2. Arc (Quarkus CDI)

Arc is Quarkus' CDI implementation, focused on build-time analysis and small runtime overhead.

Common Scopes

Scope	Usage
@ApplicationScoped	Stateless services, repositories (recommended default)
@RequestScoped	Per-request context holders
@Singleton	Single instance without CDI proxies
@Dependent	Short-lived helpers (default if no scope declared)

Bean Discovery

- · Classes become beans with scope annotations or producer methods
- Use @Qualifier to disambiguate multiple implementations

• Instance<T> for programmatic bean selection

Example

```
@ApplicationScoped
public class ProductService {
    @Inject ProductRepo repo;

    public List<Product> findActive() {
        return repo.findByActive(true);
    }
}
```

1.3. Native Compilation with GraalVM

Benefits

- Millisecond startup times
- Drastically reduced memory footprint
- Ideal for serverless and microservices

Constraints

- Reflection needs explicit configuration
- Dynamic proxies require substitution
- Some dynamic classloading limitations

Configuration

Use @RegisterForReflection for classes accessed via reflection:

```
@RegisterForReflection
@Entity
public class Product extends BaseModel {
    // Ensures reflection metadata in native image
}
```

1.4. Extension Ecosystem

Quarkus provides extensions for: - **Data**: MongoDB, PostgreSQL, Redis, Elasticsearch - **Security**: JWT, OIDC, OAuth2, RBAC - **Messaging**: Kafka, AMQP, JMS - **Observability**: Metrics, tracing, health checks - **Cloud**: AWS, Azure, Google Cloud integrations

1.5. Quantum's Quarkus Integration

Quantum leverages Quarkus for: - CDI: Dependency injection for repositories and services - JAX-RS:

REST endpoint framework via BaseResource - **Security**: JWT/OIDC integration for authentication - **MongoDB**: Morphia integration for persistence - **Configuration**: MicroProfile Config for settings - **OpenAPI**: Automatic API documentation

1.6. Getting Started with Quarkus

Create Project

```
mvn io.quarkus:quarkus-maven-plugin:create \
    -DprojectGroupId=com.example \
    -DprojectArtifactId=my-app \
    -DclassName="com.example.MyResource" \
    -Dpath="/hello"
```

Development Mode

```
./mvnw quarkus:dev
```

Native Build

```
./mvnw package -Pnative
```
